Comparing two means

Let $\{X_1, \dots, X_{n_x}\}$ and $\{Y_1, \dots, Y_{n_y}\}$ be two i.i.d samples and consider the following problem:

$$H_0: \mu_x = \mu_y \quad \text{vs} \quad H_1: \mu_x \neq \mu_y$$

$$H_0: \mu_x - \mu_y = 0 \quad \text{vs} \quad H_1: \mu_x - \mu_y \neq 0$$

We define the test statistics $T = \frac{\bar{X}_{n_x} - \bar{Y}_{n_y} - 0}{\text{Standard deviation} = \sqrt{\text{Var}\{\bar{X}_{n_x} - \bar{Y}_{n_y}\}}} = \frac{\bar{X}_{n_x} - \bar{Y}_{n_y}}{\sqrt{\frac{S_x^2}{n_x} + \frac{S_y^2}{n_y}}}$

$$S_x^2 = \frac{1}{n_x - 1} \sum_{j=1}^{n_x} (X_j - \bar{X}_{n_x})^2$$

$$S_y^2 = \frac{1}{n_y - 1} \sum_{j=1}^{n_y} (Y_j - \bar{Y}_{n_y})^2$$

► t-test ($n_x + n_y - 2$ degrees of freedom)

under the null hypothesis

$$E\{\bar{X}_{n_x} - \bar{Y}_{n_y}\} = E\{\bar{X}_{n_x}\} - E\{\bar{Y}_{n_y}\} = \mu_x - \mu_y = 0$$

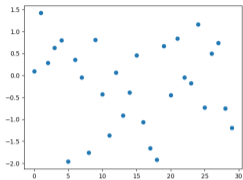

$$\begin{aligned} \text{Var}\{\bar{X}_{n_x} - \bar{Y}_{n_y}\} &= \text{Var}\{\bar{X}_{n_x}\} + \text{Var}\{\bar{Y}_{n_y}\} = \\ &= \frac{S_x^2}{n_x} + \frac{S_y^2}{n_y} \end{aligned}$$

Hence $T \sim t_{df=n_x+n_y-2}$
